

Singleton Systems Sprint

One lean operating model for the website, Bear, Eagle, Notion, Raycast, Codex skills, and future hooks.

Big Idea

Name the system once, then let each app do its job. The point is to stop turning every good idea into a new place, new tag, or new rule.

Video is the wedge. Repeatable systems are the real skill.

The App Jobs

Bear

-> quick capture lanes

Eagle

-> proof and visual assets

Notion

-> durable structure

Raycast

-> action buttons

Codex docs

-> rules, copy, decisions

Skills

-> focused helpers

Hooks

-> later context reminders

Locked V1

- pipeline-systems-audit is the current home hub.
- singleton-systems is the pending repo/folder name.
- Eagle uses outcome folders, not source folders.
- Bear uses lean tag lanes, not one giant dump page.
- MCP is operator/control, not a hard dependency.

The Buckets

Website

Offer

Video

Workflow

Codex

Career

Personal Systems

LikeC4 direction: small maps, clear colors, simple labels, and one meaning per node.

Bear Lanes

video

workflow

website

codex

npc

npc maps to Eagle **04 Personal Systems**. **codex/systems** is the first nested test lane for planning docs.

Pending

- Rename the local repo folder when timing is clean.
- Build a Bear Raycast wrapper like Career HQ wrappers.
- Add small Codex hooks only when they reduce drift.
- Build the Singleton Systems LikeC4-style map.
- Reference Prospect Pipeline for source-of-truth discipline, not old company language.
